

PHISHING

PHISHING TYPES

1. Email Phishing
2. Spear Phishing
3. Whaling
4. Smishing and Vishing

EMAIL PHISHING

- Email phishing involves fraudulent emails aiming to obtain sensitive information. Beware of suspicious links and requests from seemingly legitimate sources to prevent identity theft and financial loss

SPEAR PHISHING

- Spear phishing targets specific individuals or organizations with personalized messages to trick them into revealing confidential information or installing malware. Stay vigilant.

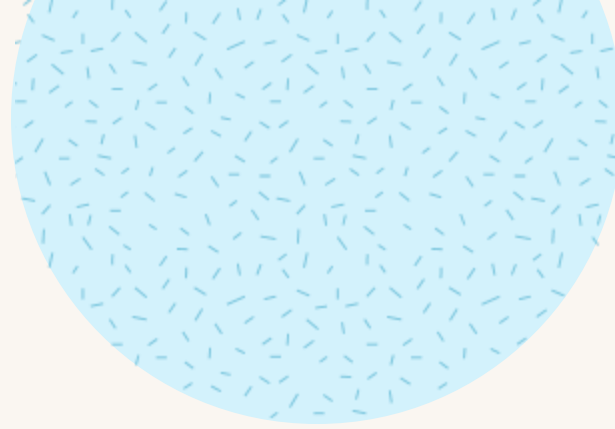

WHALING

- Whaling in phishing refers to targeted attacks on high-profile individuals or organizations to steal sensitive information or money through deceptive emails or websites.

SMISHING AND VISHING

- Smishing involves fraudulent text messages aimed at tricking individuals into divulging personal information, while vishing uses phone calls to deceive victims into revealing sensitive data or performing actions against their interest

To evade phishing, scrutinize unsolicited emails, confirm sender legitimacy, avoid clicking on dubious links or attachments, and update security software regularly. Implement multi-factor authentication, educate yourself and others about phishing tactics, and be wary of urgent requests for personal or financial information, especially if they evoke fear or urgency.
